

1 Company Profile

Vizalytics Technology, Inc. is a United States C-Corporation, incorporated in the state of Delaware with corporate offices at 40 Wall Street, New York, New York. We have been operating since 2012.

Vizalytics' core expertise is in using innovative approaches to knowledge representation applied to disparate spatio-temporal data sources, which enables the surfacing of valuable insights for a wide variety of customers. Our senior management team members are experts in open data, content representation, and graph-based analytics. Our core insight analytics technology is patent pending.

Vizalytics has a proven track record in both the public and private sector providing data driven solutions for a wide variety of customers. In New York City and Chicago, our Mind My Business™ mobile app is used by thousands of brick and mortar shopkeepers.

Through a private/public partnership with the City of New York, Vizalytics created neighborhoods.nyc, providing resident-focused sites, driven by open data for each of the nearly 400 neighborhoods in NYC. In addition, Vizalytics has worked with neighborhood not-for-profit organizations to help them customize and bring more value to those sites.

Another private/public partnership with the city of Hoboken, NJ applies open data to the commuting problem, using analysis and route optimization to present efficient multi-modal transportation options across the Northern NJ and NYC area.

Vizalytics has worked in Copenhagen with the City Data Exchange and delivered on an initial analytics contract with Wonderful Copenhagen in 2016.

Our complete capabilities statement is attached below.

2 Project Fulfillment and Execution

All Vizalytics Insight Builder products are developed on top of the patent-pending Vizalytics Knowledge Graph platform. The Wonderful Copenhagen pilot project will deliver a custom insight lens on this platform, providing insight analytics specific to the tourism industry in Copenhagen, Denmark.

Development is planned using an agile development model. The intent is to quickly get initial capabilities in place so that they can be tested and optimized for the Wonderful Copenhagen use case.

Details are provided in the paragraphs below.

2.1 Consultancy

Vizalytics Technology, Inc. has extensive experience with data analytics, from initial data audits through the development of highly scalable data platforms with custom business intelligence analytics. We are currently serving as expert consultants in data collection, representation and analysis with the City University of New York's federally funded disaster planning project and with the City of New York in the re-platforming of NYC 311 – a data intensive application that serves millions of New York City residents annually.

Our custom development projects are each developed using agile development processes. Vizalytics team members are trained and experienced with formal agile processes. Aileen Gemma Smith is a certified scrum master.

As part of the consulting portion of this project, Vizalytics will work with Wonderful Copenhagen to agree on a final project design, building on the results of the pilot project. This will include recommendations on additional data to be captured, optimization of insight presentation and tuning of the platform interaction model.

2.2 Identification of Data Sources

Vizalytics Technology, Inc. has completed an extensive audit of open data sources in the Greater Copenhagen area. For this pilot project we expect to use several open data sets from opendata.dk, the Copenhagen City Data Exchange, Open Street Maps and other data providers. Data we plan to leverage includes semi-static geographical data such as:

- Transit schedules,
- Parking locations and restrictions,
- Bus shelters, and
- Bicycle rack locations

Spatio-temporal data, both historical and near real time, including:

- Copenhagen Card data,
- Copenhagen Card App mobility data,
- Transportation alerts, and
- Weather data

Our content and knowledge representation teams have deep expertise in combining multiple data sets in semantically meaningful ways to support the extraction of meaningful business insights. In New York City alone, the Vizalytics Knowledge Graph that drives our products combines and analyzes more than three dozen data sets being updated in real time 24 hours a day.

2.3 Business Intelligence Platform

The Wonderful Copenhagen visitor analytics pilot platform will be hosted in EU and will provide 24/7 access to Wonderful Copenhagen and affiliate users for the duration of the pilot period.

Vizalytics is a technical partner of Amazon Web Services and will deliver the pilot from the AWS cloud. The AWS Cloud environment maintains certification with robust security standards such as ISO 27001, SOC 1/2/3 and PCI DSS Level 1. The EU Article 29 Working party has approved the AWS Data Processing Agreement. We do not foresee maintaining any personally identifiable information for this pilot, but our infrastructure provides the necessary data protection.

The Vizalytics Knowledge Graph platform supports all relevant spatio-temporal data required to provide the requested recommendations and insights. Specifically, the platform supports:

- Semi-static geographical data such as road networks, transit routes, defined polygonal areas, point locations, etc.
- Temporal data such as operating hours
- Event based spatio-temporal data modeling such things as real time visitor locations, card swipes, transit vehicle locations, etc.
- Real time and historical data of the types described above.

The Vizalytics Knowledge Graph platform provides an insight generation capability that presents actionable insights in textual format. Access to these insights requires no technical or data analysis skills. Visual presentations augment the textual information with intuitive map displays and charts where applicable.

2.4 Timeline

Vizalytics is prepared to deliver the pilot project according to the proposed schedule with a beta capability available in early May 2017 and a full go live date at the end of May 2017.

3 Key Team Members

Aileen Gemma Smith – CEO/Founder. Subject matter expert and content specialist with years of experience with public data.

Chris Smith – CTO. Domain expertise and extensive experience with data analytics, software engineering and knowledge representation. National Science Foundation principal researcher.

Satish Avadhanam – VP Engineering. Experienced engineer with significant experience building sophisticated and highly scalable search and analytics platforms.

Terry Brown – Editorial Director. Highly experienced editorial director with years of specific transit related background with the NYC MTA/LIRR, the Boston MBTA, and the Boston Central Artery/Tunnel Project.

4 Previous Experience

4.1 Neighborhoods.nyc

Link: <http://www.neighborhoods.nyc>

The neighborhoods project was developed as a public private partnership with the City of New York. Driven by the Vizalytics Knowledge Graph and NYC open data, it provides dynamic neighborhood insights for each of the nearly 400 neighborhoods of New York City.

4.2 Mind My Business™

Link: <http://www.mindmy.biz>

Mind My Business™ provides accessible, actionable business intelligence for brick and mortar shopkeepers. Awarded Best Mobile App at NYC Big Apps 2014, it saves shopkeepers money, providing business insights without any need for data analytics savvy.

4.3 311 Next

Link: <http://www1.nyc.gov/311/index.page>

NYC 311 provides non-emergency services and information services to 8.3 million NYC residents and coordinates data among city agencies. As recognized subject matter experts on open data, Vizalytics is helping to lead content and data analysis process for the recently awarded re-platforming of the system.

5 Budget

Task	Price
Consulting, Project Management	kr. 75,000
Data Set Ingest	kr. 75,000
Machine Learning and Custom Analytics	kr. 125,000
Testing and Deployment	kr. 25,000
	kr. 300,000
